APPENDIX D. NARROW BAND SOUND POWER LEVEL DATA	231
APPENDIX E. BLADE WAKE DATA	253

INTRODUCTION

This volume contains a detailed description and evaluation of the anechoic platform used during the test of a 0.457 m (18 in.) diameter Q-FanTM as part of NASA contract NAS 1-11670. Also included in this volume are: 1) 1/3 octave band analyses of the fan noise data, 2) narrow band analyses of the fan noise for selected test conditions, 3) narrow band sound power level data for all fan test conditions analyzed, and 4) the velocity and air angle evaluation of blade wake data.

Discussion of the test data contained herein will be found in a low-number NASA report of the same title: "Noise and Wake Structure Measurements in a Subsonic Tip Speed Fan."

APPENDIX A

ACOUSTIC FIELD CALIBRATION

Since the acoustic measurements were made over asphalt, an anechoic platform was used to reduce the reflections from the ground plane to better simulate free-field conditions. This platform, located mid-way between the source and the microphone, absorbed the reflected wave and prevented strong cancellations and reinforcements of the direct wave at the microphone.

The platform consisted of a plywood frame covered with 7.6 cm (3 in.) thick bats of fiberglass as shown in figures A-1 and A-2. In order to assess the effectiveness of this platform, an acoustic calibration was conducted in which a speaker was used as an acoustic noise source. For this calibration, the platform was located directly in front of a 50-watt capacity speaker. Two microphones (near microphone and far microphone) were located at the same height as the speaker with the near microphone positioned so the reflected wave would be at least 10 dB below the direct wave. This near microphone was used to determine the source noise while the far microphone measured the resultant noise due to both the direct and reflected wave. The speaker was tilted downward so its directivity indices in the direction of the direct wave and reflected wave were equal. This is shown in figure A-3 along with the locations of the microphones, platform, and speaker for the test.

Data recordings were made simultaneously for the 2.13 m (7 ft) and 7.62 m (25 ft) microphones on two single track Nagra III tape recorders, both with and without the anechoic platform. The data were analyzed by both 10 Hz narrow band filters and 1/3-octave band filters. Figure A-4 shows the narrow band analysis of the data from the 7.62 m (25 ft) microphone with and without the platform compared to the source noise measured at 2.134 m (7 ft). The results of 1/3-octave band analysis of the data are presented in figure A-5.

The data in figure A-4 show that the platform is very effective in reducing the interference field since the data without the platform show trough-to-peak heights of 10 dB or more while the data with the platform show excursions typically less than 2 dB. Figure A-5 shows the 1/3-octave band data corresponding to the narrow band data in figure A-4. It can be seen that the situation with the platform is improved and in general, the difference between measured and calculated free field levels with this platform installed is 2 dB or less.

APPENDIX B

ONE-THIRD OCTAVE BAND SOUND PRESSURE LEVEL DATA

The following pages contain the processed 1/3 octave band SPL's for all the fan operating conditions analyzed. The data for each condition consist of three pages. The first page presents the raw, uncorrected data as processed through the analyzer. The second page presents the data corrected for excess atmospheric attenuation and the calculated PWL's for those data. Also shown are the calculated PWL's on a sideline and constant radius assuming standard day excess atmospheric attenuation. Finally, the third page presents the data scaled to a thrust of 66720 N (15,000 lb) at a 152m (500 feet) sideline distance.

APPENDIX C

NARROW BAND SOUND PRESSURE LEVEL DATA

The narrow band (60 Hz bandwidth at the 3 dB down points) sound pressure levels from approximately 20 Hz to 20,000 Hz for selected test conditions used in this report are presented in this section. Most of the analyses represent 512 ensemble averages and, thus, have good statistics since that represents approximately 26 seconds of data.

APPENDIX D

NARROW BAND SOUND POWER LEVEL DATA

The narrow band SPL data presented in Appendix C was used to calculate the PWL of the harmonic (i.e., at multiples of blade passing frequency) and 1/2 harmonic (i.e., the broadband noise in between harmonics) noise for the fan. These are presented in this appendix for all the conditions analyzed in the program. Note that the broadband levels are based on an analyzer bandwidth of 60 Hz.

APPENDIX E

BLADE WAKE DATA

This section contains the signal-enhanced plots of the measured rotor blade wakes. Table E-I summarizes the data contained herein. The figures show the two velocity components which were measured plus the resultant velocity and the air angle for both the stationary (stator) and the rotor coordinate systems for the 20 measurements made in this test program.

TABLE E-I

SUMMARY OF FLOW CONDITIONS, STATOR SPAN LOCATIONS,
AND ROTOR BLADES FOR WHICH FAST RESPONSE DATA IS PRESENTED

Flow Condition	Rotor Speed	Blade Angle	Pressure Ratio	Span Location	No. of Blades	Figures
